ANGLE BRACKET FOR SHEAR AND TENSILE FORCES

TITAN N

Ideal for CLT, it is easy to install thanks to the raised holes. Values also certified with partial fastening for presence of bedding mortar or root beam.

80 kN SHEAR

Exceptional shear strengths. Up to 82,6 kN on concrete (with TCW washer). Up to 46,7 kN on timber.

70 kN TENSILE

On concrete, TCN angle brackets with TCW washers provide excellent tensile strength. $R_{1,k}$ up to 69,8 kN characteristic values.

CHARACTERISTICS

| FOCUS | shear and tensile joints |
|-----------|---|
| HEIGHT | 120 mm |
| THICKNESS | 3,0 mm |
| FASTENERS | LBA, LBS, VIN-FIX PRO, EPO-FIX PLUS, SKR, AB1 |

MATERIAL

Bright zinc plated carbon steel, three dimensional perforated plate.

FIELDS OF USE

Shear and tensile joints for timber-to-concrete and timber-to-timber applications

- CLT, LVL
- solid timber and glulam
- framed structures (platform frame)
- timber based panels

CONCEALED HOLD DOWN

Ideal on timber-to-concrete both as a hold down at the ends of the walls and as shear angle bracket along the walls. It can be integrated into the floor panels.

ALL DIRECTIONS

Certified shear $(F_{2,3})$, tensile (F_1) and tilting $(F_{4,5})$ strengths. Values certified also for partial fastenings and with interposed acoustic profiles.

MATERIAL AND DURABILITY

TITAN N: carbon steel DX51D+Z275. TITAN WASHER: S235 bright zinc plated carbon steel. To be used in service classes 1 and 2 (EN 1995-1-1).

XYLOFON PLATE: 35-shore polyurethane compound. ALADIN STRIPE: Compact EPDM.

FIELD OF USE

- Timber-to-concrete joints
- Timber-to-timber joints
- Timber-to-steel joints

Precut INA threaded rod, with nut and washer: see page 520 MGS threaded rod class 8.8 to be cut to size: see page 534

GENERAL PRINCIPLES:

TCN200 - TCN240 | PARTIAL FASTENING PATTERNS FOR STRESS F2/3

In the presence of design requirements such as $F_{2/3}$ stresses of different value or the presence of an intermediate H_B layer (levelling mortar, sill or ground) between the wall and the supporting surface, partial fastening patterns can be adopted:

Pattern 2 also applies in case of F_4 , F_5 and $F_{4/5}$ stresses.

MAXIMUM HEIGHT OF THE INTERMEDIATE $\mathrm{H}_{\mathrm{B}}\,\mathrm{LAYER}$

| | CLT | | | | | GL | |
|----------------------------|----------------------|-----------------|------------------------|-------------------------|-------------------------|-------------------------|--|
| configuration on timber | n _v holes | Ø5 [pcs] | H _{B max} | , [mm] | H _{B max} [mm] | | |
| | TCN200 | TCN240 | nails LBA Ø4 | screws LBS Ø5 | nails LBA Ø4 | screws LBS Ø5 | |
| • full pattern | 30 | 36 | 20 | 30 | 32 | 10 | |
| • pattern 4 | 25 | 30 | 30 | 40 | 42 | 20 | |
| • pattern 3 | 20 | 24 | 40 | 50 | 52 | 30 | |
| • pattern 2 | 15 | 18 | 50 | 60 | 62 | 40 | |
| • pattern 1 | 10 | 12 | 60 | 70 | 72 | 50 | |

The height of the H_B intermediate layer (levelling mortar, sill or timber platform beam) is determined by taking into account the following regulatory requirements for fastenings on timber:

CLT: minimum distances according to ÖNORM EN 1995-1-1 (Annex K) for nails and ETA-11/0030 for screws.

• C/GL: minimum distances for solid timber or glulam with horizontal fibres consistent with EN 1995-1-1 according to ETA considering a timber density of $\rho_{k} \le 420 \text{ kg/m}^3$.

TCN200 - TCN240 | VERIFICATION OF ANCHORS FOR CONCRETE FOR F_{2/3} STRESS

Fastening elements to the concrete through anchors shall be verified according to the load acting on the anchor, which can be evaluated through the geometric parameters on the table (e).

Ey calculation eccentricities vary depending on the type of installation selected: 2 internal anchors (IN) or 2 external anchors (OUT).

The anchor group must be verified for:

 $V_{Sd,x} = F_{2/3,d}$ $M_{Sd,z} = F_{2/3,d} \times e_{y'IN/OUT}$

| | • pattern 2 | LBS screws | Ø5,0 x 50 | 10 + 10 | 23,2 | 50.,0 | Үмо | | | 0,40 | 0,04 |

The group of 2 anchors must be verified for: $V_{Sd,y} = 2 \times k_{t\perp} \times F_{4/5,d}$; $N_{Sd,z} = 2 \times k_{t/} \times F_{4/5,d}$

The F₄, F₅, F_{4/5} values in the table are valid for the acting stress calculation eccentricity e=0 (timber elements prevented from rotating). For joints with 2 angle brackets, in case the stress F_{4/5,d} is applied with eccentricity e≠0, the verification for combined loads is required considering the contribution of the additional tensile component:

 $\Delta F_{1,d} = F_{4/5,d} \cdot \frac{e}{b}$

NOTES:

 $^{(1)}$ Installation of the anchors in the two internal holes (IN).

NOTES:

- ⁽¹⁾ The TTN240 angle bracket can be installed in combination with different resilient acoustic profiles inserted below the horizontal flange in full pattern configuration. The strength values in the table are given in ETA-11/0496 and calculated according to *'BlaB, H.J. und Laskewitz, B. (2000); Load-Carrying Capacity of Joints with Dowel-Type fasteners and Interlayers.*", conservatively disregarding the stiffness of the profile.
- (2) Profile thickness: in the case of ALADIN profile, the calculation took into account the reduced thickness, due to the corrugated section and the consequent crushing induced by the nail head during insertion.

The F₄, F₅, F_{4/5} values in the table are valid for the acting stress calculation eccentricity e=0 (timber elements prevented from rotating). For joints with 2 angle brackets, in case the stress F_{4/5,d} is applied with eccentricity e≠0, the verification for combined loads is required considering the contribution of the additional tensile component:

GENERAL PRINCIPLES:

GENERAL PRINCIPLES:

 Characteristic values are consistent with EN 1995-1-1 and in accordance with ETA-11/0496. The design values of the anchors for concrete are calculated in accordance with the respective European Technical Assessments (see Chapter 6 ANCORS FOR CONCRETE). The connection design strength values are obtained from the values on the table as follows:

$$R_{d} = min \begin{cases} \frac{R_{k, timber} \cdot K_{mod}}{\gamma_{M}} \\ \frac{R_{k, steel}}{\gamma_{steel}} \\ R_{d, concrete} \end{cases}$$

The coefficients k_{mod}, γ_M and γ_{steel} should be taken according to the current regulations used for the calculation.

- Dimensioning and verification of timber and concrete elements must be carried out separately. Verify that there are no brittle fractures before reaching the connection strength.
- Structural elements in timber, to which the connection devices are fastened, must be prevented from rotating.
- For the calculation process a timber density ρ_k = 350 kg/m³ has been considered. For higher $_k$ values, the strength on timber side can be converted by the k_{dens} value:

$$k_{dens} = \left(\frac{\rho_k}{350}\right)^{0.5} \text{ for } 350 \text{ kg/m}^3 \leq \rho_k \leq 420 \text{ kg/m}^3$$
$$k_{dens} = \left(\frac{\rho_k}{350}\right)^{0.5} \text{ for LVL with } \rho_k \leq 500 \text{ kg/m}^3$$

- In the calculation phase, a strength class of C25/30 concrete with thin reinforcement was considered, in the absence of spacing and distances from the edge and minimum thickness indicated in the tables listing the installation parameters of the anchors used. The strength values are valid for the calculation hypotheses defined in the table; for boundary conditions different from the ones in the table (e.g. minimum distances from the edge or different concrete thickness), the concrete-side anchors can be verified using MyProject calculation software according to the design requirements.
- Seismic design in performance category C2, without ductility requirements on anchors (option a2) elastic design according to EOTA TR045. For chemical anchors subjected to shear stress it is assumed that the annular space between the anchor and the plate hole is filled (α_{gap} =1).
